

APPDS Architecture

- MDD - Metadata description. It is assumed that this is a description of the structure of binary files (Kaitai) with an indication of what is metadata.
- E1, E2, ... - Metadata extractors. These are services that ensure the retrieval of meta-information and the registration of incoming data in the metadata database.
- A1, A2, ... - Adapters. Adapters provide unified API to access to the data on local storage. We consider the local storage as a file storage.
